

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

a daily paper: Vitascope, kinetoscope, phantoscope, criterioscope, cinematograph, biograph, kinematograph, wonderscope, animatoscope, vitagraph, panoramograph, cosmoscope, anarithmoscope, katopticum, magniscope, zeoptrotrope, phantasmagoria, projectoscope, variscope, cinograph, cinomograph, hypnoscope, centograph, x-ograph, electroscope, cinagraphoscope, craboscope, vitaliscope, cinematoscope, muto-scope, cinoscope, animaloscope, theatograph, chronophotographoscope, motograph, kinetograph, rayoscope, motorscope, kinetinephone, thromotrope, phenakistoscope, venetrope, virtescope, zinematograph, vitopticon, stinetiscope, vivrescope, diaramiscope, lobsterscope, cornomograph, kineoptoscope.

#### UNIVERSITY AND EDUCATIONAL NEWS.

DR. E. BENJAMIN ANDREWS, President of Brown University, has been elected Superintendent of the Chicago Schools by the Board of Education. Thirteen votes were cast for Dr. Andrews and six for Albert G. Lane, the present Superintendent. Dr. Andrews will accept, and will assume the duties immediately. Professor Benjamin Ide Wheeler, who holds the chair of Greek at Cornell University and is an alumnus of Brown University, is prominently mentioned in connection with the vacant presidency.

PROFESSOR JOHN M. COULTER, head of the department of botany in the University of Chicago, is Principal of the Winona Assembly and Summer School, which is holding a session from July 4th to August 28th. The buildings and grounds have been fitted up at a cost of about \$300,000.

THE sixth volume of the *Annual Register* of the University of Chicago is a book of 480 pages. The summary of attendance shows a total enrollment for the year of 2,307 students, 1,428 men and 879 women. By quarters the figures are:

Summer, '97,.....	1273
Autumn, '97,.....	1170
Winter, '98,.....	1169
Spring, '98,.....	1094

THE enrollment of students in the University of Nebraska for the year 1897-98 was as follows:

Graduate students,.....	143
Collegiate students,.....	993
Law students,.....	102
Special professional students,.....	30
Agricultural and mechanical school,.....	36
School of art and music,.....	325
Preparatory school,.....	190
Summer school,.....	262

Deducting duplicated names there were 1915 in all, of which 1,043 were men and 872 women. The instructional staff and assistants numbered 184.

Two hundred and fifty students were enrolled in the summer session of the University of Nebraska, June 6th to July 16th. Hitherto this has been a semi-independent summer school, but this year the experiment was made of offering condensed courses of regular University work. By more frequent meetings of classes and more hours per week in the laboratories, as much was accomplished in many subjects in six weeks as in a full semester under ordinary conditions. The success of the summer session just closed encourages the University authorities to continue the experiment next year. Fully sixty-five per cent. of the students in this session were teachers in the schools of the State.

IT has been ordered by the Russian Minister of Public Instruction that the number of Jewish students in any faculty of the University of Moscow shall not exceed three per cent. of the total number of students in that faculty.

THE Egyptian Ministry of Public Instruction advertises for a senior and a junior professor of agriculture for the School of Agriculture, Gheezeh. The salaries are about \$2,500 and \$1,500 per annum. Applications may be made before August 12th to the Principal of the School, W. C. Mackenzie, D.Sc., 6 Hartington Gardens, Edinburgh.

IN the absence of Mr. W. H. R. Rivers, who is accompanying Professor Haddon on his expedition to the Torres Straits, courses in experimental psychology in University College, London, will be given by Mr. E. T. Dickson.

DR. WILLY KUNKELTHAL, associate professor of zoology at Jena, has been called to a full professorship in Breslau; Dr. F. J. Becker, professor of mineralogy in the German University at Prague, has been called to Vienna.

DR. GEORG KARSTEN, docent in botany in Kiel, Dr. Richard Abegg, docent in physical chemistry at Göttingen, and Dr. Böhming, docent in zoology at Gratz, have been promoted to associate professorships. Dr. Reitzenstein has qualified as docent in chemistry at Würzburg and Dr. Simon as docent in physics in Göttingen.

#### DISCUSSION AND CORRESPONDENCE.

##### SUBSTITUTIONAL NERVOUS CONNECTION.

In a series of recent papers the writer has endeavored to show that the idea now apparently dominant that, with the single exception of the olfactory, the peripheral nervous connections are indirect rather than direct is an unwarrantable assumption. It has been found possible to demonstrate in the skin termini of nerves which are, so far as can be seen, unimpeachable instances of connection by continuity. These are then of the same nature as the connections of the olfactory cells with the fibres of the olfactory nerve. On the other hand, it appears that some of the most careful observers have detected similar rod-cells with special nervous functions which are only in indirect communication with the nerve which conveys the stimulus. If it could be shown that the sensory cells are uniformly without nervous processes it might be assumed that they constitute by themselves a special class of nervous organs which normally do not acquire the neurite, but the admitted existence of such a process of the olfactory cells and the fact that these cells are otherwise so similar to the other instances of nervous endings, in which it seems to be proved that this sort of direct connection is absent, prevents the possibility of establishing such an independent class of structures. Still more, if our own observations are taken into account, it seems necessary to offer some other suggestion to account for the discrepancy in this particular. Take, for illustration, the case of the organs of taste, which, in spite of their evident resemblance to the olfactory termini, are generally stated to have only indirect nervous connections. I have elsewhere suggested the possibility that in the case of these sense organs the original proton is to be found in the same paired bands of cells from which the olfactory

epithelium is derived. It is admitted that to these other elements have possibly been added by way of the gill clefts, but it seems only natural to suppose that the palatal portion, at any rate, may have had the origin suggested. If this were so, it is evident that there is no relation between the position of the peripheral proton and the source of the nerves supplying these organs. It might be suggested, therefore, that the original nervous communication having been lost, the new connection has been established in a secondary manner by the apposition of what at one time were free termini between the cells to these specialized cells. If the illustration chosen appears far-fetched, a more general illustration will indicate still more clearly the application of theory proposed. There can be no doubt that, on any theory of evolution of the higher vertebrates from the lower, a difficulty arises in the attempt to construe the fact that the lateral line organs with their homologues and allies do not seem to obey a constant law of nervous supply, while in the higher vertebrates it is difficult to follow the transformations which these organs have undergone. It is possible that these difficulties will largely disappear if the probability be admitted that, in the course of evolution, the original connections have been lost or diverted and that new ones have then been established by the application of some of the free nerve endings to the cells thus deprived of their original nervous connections. That some such changes have taken place seems to the writer more than probable. If this be admitted, it is not to be wondered at that in the lower vertebrates especially the two sorts of endings may be encountered side by side in different parts of the skin. It is not the present intention to enlarge on or illustrate this thought, which is thrown out in the hope that the suggestion may prove fruitful in the hands of others.
